This panel ended up taking on multiple tabs of data, from the ability to turn on beta features in real time to visualizing mLLM data that was being processed in the cloud (via OpenAI)

The overall experience merged our beautiful and advanced 3d interface with the ability to overlay data beyond just a print out of numbers. This helped engineers understand and track data live in the vehicle and gather conclusions even before they could get back to their desk to analyze the data.

This saved hundreds of hours of engineering time a month.
